

WORK SHEET

Unit15 Software Installation

P4 Criteria

Completed installation request forms and annotated screen shots.

1. Windows 10 installed

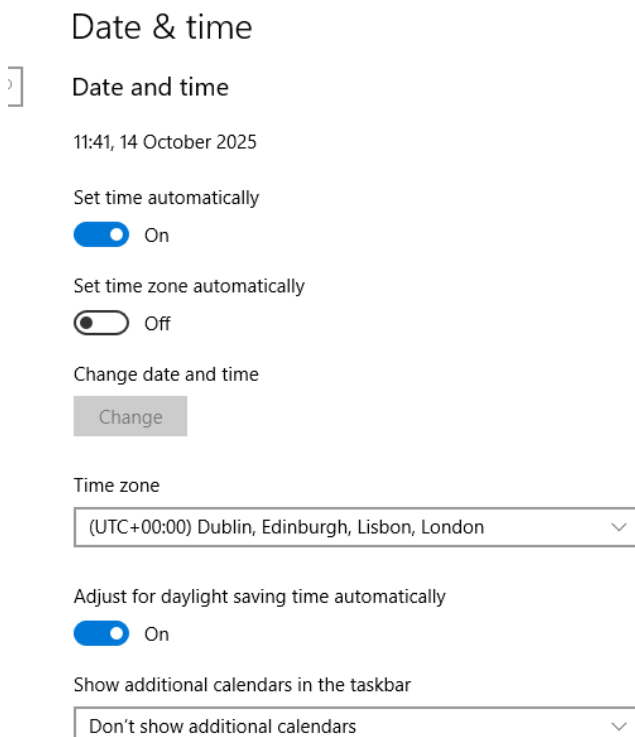

The screenshot shows the Windows 10 'System' settings window. The left sidebar contains links to 'Device Manager', 'Remote settings', 'System protection', and 'Advanced system settings'. The main content area is titled 'View basic information about your computer' and displays the following information:

- Windows edition:** Windows 10 Pro, © 2017 Microsoft Corporation. All rights reserved.
- System:**
 - Processor: AMD Ryzen 5 2600 Six-Core Processor, 3.39 GHz
 - Installed memory (RAM): 8.00 GB
 - System type: 64-bit Operating System, x64-based processor
 - Pen and Touch: No Pen or Touch Input is available for this Display
- Computer name, domain and workgroup settings:**
 - Computer name: Cruz
 - Full computer name: Cruz
 - Computer description:
 - Workgroup: WORKGROUP
- Windows activation:** Windows is not activated. Product ID: 00330-80000-00000-AA300.

At the bottom left, there is a link to 'See also Security and Maintenance'.

Correct date and time

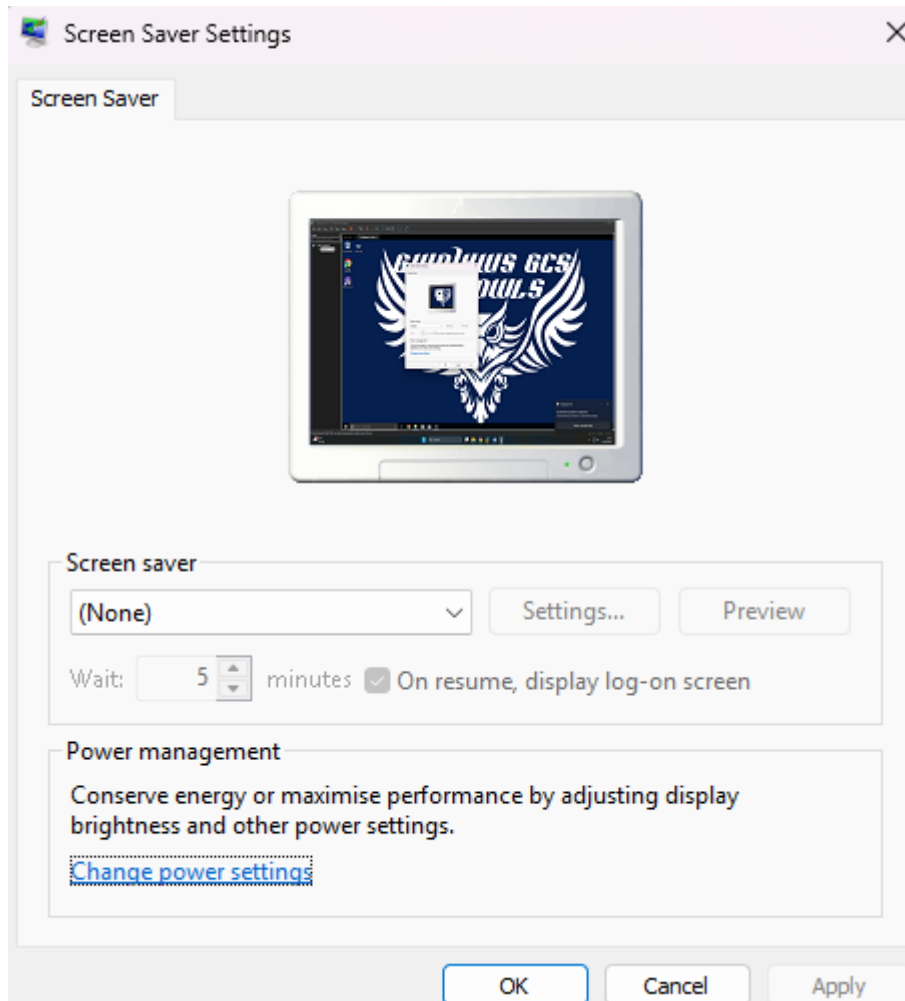

The screenshot shows the Windows 'Date & time' settings window. The left sidebar contains a link to 'Date and time'. The main content area displays the following settings:

- Date & time:** 11:41, 14 October 2025
- Set time automatically:** On
- Set time zone automatically:** Off
- Change date and time:** Change
- Time zone:** (UTC+00:00) Dublin, Edinburgh, Lisbon, London
- Adjust for daylight saving time automatically:** On
- Show additional calendars in the taskbar:** Don't show additional calendars

Background to owl

Screensaver to none

Automatic updates for 8pm

Active hours

Set active hours to let us know when you typically use this device. We won't automatically restart it during active hours and we won't restart without checking if you're using it.

Start time

OK

Cancel

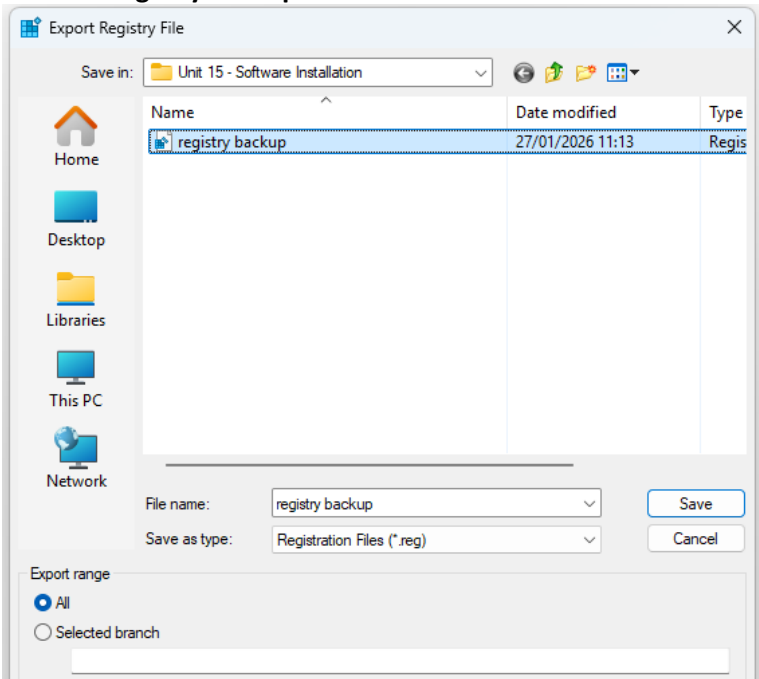

Perform an AV scan

Install Office 2007

Create a registry backup

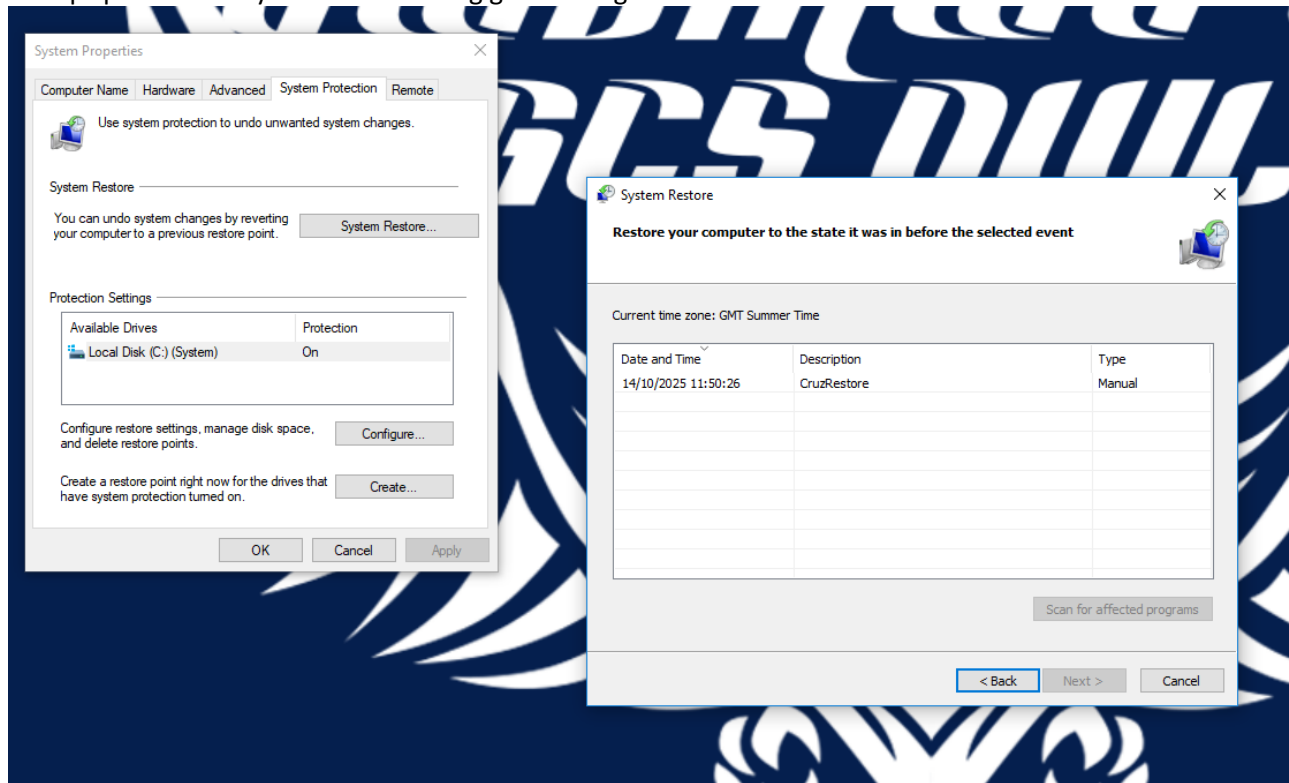

M3 criteria

Explain the following backup methods and include screen shots. Discuss advantages and benefits of each method.

Restore Point

A Restore Point is a feature in Windows that saves a copy of important system files, settings, and drivers at a specific time. It helps protect the system if something goes wrong.

Advantages

- Helps recover the system from errors
- Keeps personal files safe
- Useful before installing new software or updates

Disadvantages

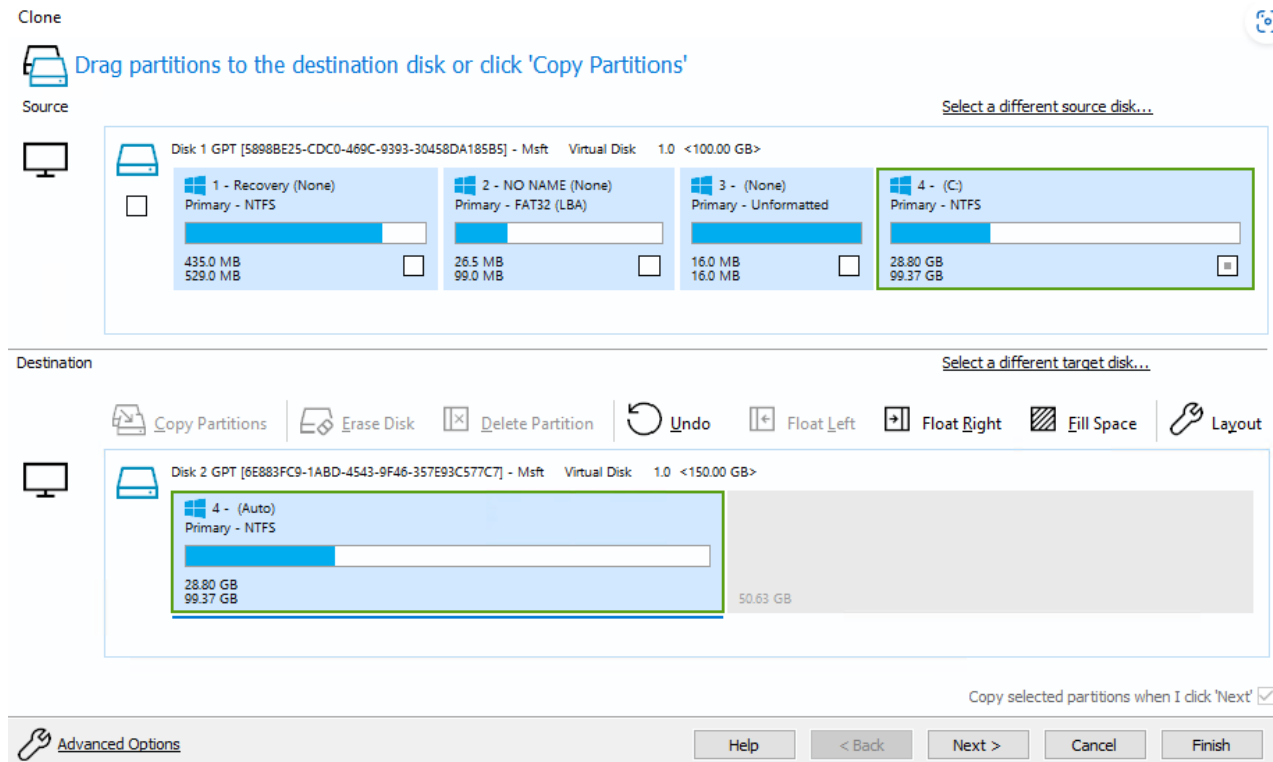

- Does not restore deleted personal files
- Uses disk space
- Cannot fix hardware problems

It allows your pc to return to a previous working version without affecting your personal files like documents, photos or videos.

We need a restore point to recover the system after errors, such as failed software installations, virus issues or incorrect driver updates.

Clone

A clone is an exact copy of a computer's hard drive or system image. It includes the operating system, installed software, settings, drivers, and files. When a system is cloned, the cloned drive can be used to restore a computer to the same state as the original system at the time the clone was created.

Advantages

- Very fast system recovery
- Ensures consistency across multiple computers
- Reduces setup and configuration time
- Includes all software, drivers, and settings
- Ideal for deploying identical systems

Disadvantages

- Requires large storage space
- Cloned image may contain outdated software or security vulnerabilities
- Hardware differences can cause driver issues
- Less flexible than file-level backups
- If the original system has problems, they are copied too

Why is it used

Cloning is used to quickly restore systems after a failure, deploy multiple computers with the same configuration, or create a backup of a fully configured system. It is commonly used in schools, businesses, and IT departments where many machines need identical setups.

Benefits of a clone

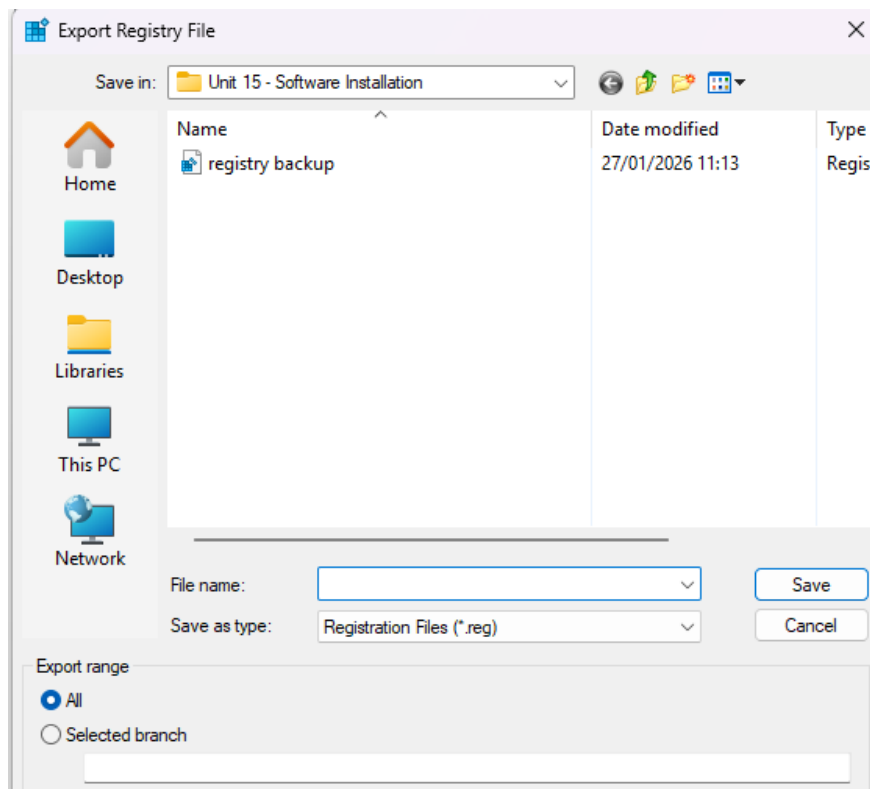

- Saves significant time compared to reinstalling software
- Reduces human error during setup
- Guarantees a known working system state
- Useful for disaster recovery

What software

Macrium Reflect is a disk imaging and cloning software used to create exact copies of hard drives and systems. It allows users to back up the entire OS, applications, drivers and files into a single image that can be restored quickly if the system fails. Macrium Reflect supports full, differential, and incremental backups, making it flexible for different backup strategies.

Registry backup

A Registry Backup is a saved snapshot of the Windows Registry database on ur pc. This database contains all the configurations, settings and options for your hardware software and user profiles

What does it do?

It exports the current state of your system's config into a file. If you make a mistake while editing the registry or if a software installation goes wrong so this backup allows you to put the old settings back into the system. So It resets the computer to a healthy state without needing to reinstall the entire OS.

Advantages

It provides a way to recover from bsod errors or system crashes caused by corrupted settings.

You can experiment with system tweaks or advanced settings knowing you can undo any damage instantly.

Some viruses change registry keys to lock you out of certain features, so a backup allows you to restore those permissions.

Disadvantages

If you back up the registry on Monday but install three new programs on Tuesday, the Monday backup will be old and won't know about the new software.

While usually small a full registry backup can grow in size over time taking up storage space if you keep too many versions. It only saves settings, not your actual files like photos or documents. If your hard drive fails a registry backup alone won't save your data.

Why do we need it?

We need it because the Registry is fragile. One typo or a deleted key in the Registry can stop your computer from booting up entirely or disable your internet and sound. Because errors from human and software bugs are common, a Registry backup is the only way to ensure that a small mistake doesn't turn into a permanent expensive repair.

P5 Criteria

Complete your test Plan.

M4 Criteria along with M5.

Colleague Testing Summary

I asked Joe to test my system to make sure it worked properly and met the client's requirements. Here are the five tests he carried out and his comments.

Test 1 – General System Check

Joe checked the desktop layout, menus and basic performance. He said the system felt smooth and easy to use. No issues found.

Test 2 – Antivirus (Panda)

He opened Panda, looked at the dashboard and ran a scan. Comment: He liked the clean layout and said it was simple to operate. The scan showed no threats. He also checked updates and saw they were set to daily. Suggestion: He said upgrading to the full version would add more protection.

Test 3 – Internet & Browser

Joe tested a few websites and streamed a short video. Comment: Everything loaded quickly and the browser felt tidy and uncluttered.

Test 4 – Software Installation

He installed a small program and tested opening/saving files. Comment: Installation was quick and the system handled it with no problems.

Test 5 – Backup & Restore (System Restore + SyncToy)

I asked Joe to run a system restore and then restore a file using SyncToy.

- System Restore: He restored the system to a previous point with no errors.
- SyncToy: He restored a backed-up file and confirmed it opened correctly.

Comment: He said the restore process was easy and he was happy with how smoothly it worked.

Changes or Upgrades I Would Make

- Upgrade Panda to full version, it gives better security for the user.
- Add more RAM to improve speed and multitasking.
- Set up automatic cloud backups, it's safer and easier than manual SyncToy backups.
- Tidy file structure, makes it easier for the user to find things.
-

Constraints Placed on Me

- The client gave me a specific list of software, so I had to stick to that.
- The client wanted Panda Antivirus but I would have preferred something built-in like Windows Defender.
- They required SyncToy for backups, even though there are more modern tools available.
- I had to stay within the budget, so I couldn't choose higher-end hardware.

P6 Criteria

Explain how the modified technology system is suitable for the intended original requirements and purpose. Create a table for each piece of software installed and task completed (e.g. automatic updates, background etc) and discuss suitability.

Package	Why is it suitable
Windows 10	Windows 10 is suitable for this project because of its familiarity for staff who are already trained on this OS. However it is important for you to remember that Windows 10 is now an outdated operating system. Since Microsoft ended official support in October 2025 it no longer receives major updates, aside from extended security support. While it works there is a long term security risk and is only suitable here if the hardware cannot run Windows 11 or if legacy compatibility is important.
Correct date and time	Having the correct date and time on a device is important because it effects how the system works. When you send an email they will be accurately timestamped, so the people getting it know exactly when it was sent. You will also receive notifications at the right time so tasks and reminders happen as expected and avoiding any confusion. The calendar system will show the correct appointments and events, helping users stay organised and avoid missed meetings. Any specialist systems, such as financial or medical software may also need the correct date and time to operate properly.
Background to architecture	Using a corporate background is suitable because it creates a professional and consistent appearance across all systems. It avoids inappropriate images that could distract users or appear unprofessional. A simple background saves time when users are looking for files and icons and helps reduce eyestrain because neutral colours are easier to view for long periods.
Screensaver to none	Disabling the screensaver is suitable because modern monitors no longer suffer from screen burn. Screen savers can be disruptive if they activate while the user is working or presenting, and they may be inappropriate if they display unsuitable images. Removing it maintains a professional working environment.
Automatic updates for 8pm	Automatic updates are very important because they keep the system secure and up to date. The system is protected from the latest vulnerabilities and benefits from improved performance and stability. Scheduling updates at 8pm avoids interrupting the user during working hours. Without updates, the system could become vulnerable to security risks
Set a restore point	Creating a restore point is suitable because it saves time if the system needs to be recovered after an error. It allows the computer to return to a previous working state. Restore points are needed if software fails, updates cause problems, or system errors occur. Without it, the user may need to reinstall software or lose settings.
Panda 2019	An anti-virus is needed is suitable because it provides protection against viruses and malware. It protects the system from cyber threats and allows the user to work safely. Without antivirus protection, the system would be vulnerable to infections and data loss.
Panda AV updates at 3am	Scheduling antivirus updates is super important because they ensure protection against the latest threats. We should choose 3am because the computer probably wouldn't be in use. Without updates to the anti virus, it may fail to detect the latest threats
Perform AV Scan	Running antivirus scans is critical because it detects and removes hidden threats. If scans are not performed, malware may remain undetected and damage the system.
Office 2007	Office 2007 is suitable because it is widely used and familiar to many users. Other clients use the same system, so files are compatible and easy to share. It is easy to use, requires less training, and avoids compatibility problems that may occur with alternatives such as OpenOffice.
Office service Pack	Installing the Office service pack is suitable because it improves performance and stability. It provides bug fixes, new features, and protects against known vulnerabilities.
Registry backup	

	A registry backup is needed because it allows recovery if system settings become corrupted, helping prevent system failure.
Macro	Creating a macro is suitable because it automates repetitive tasks. It saves time, improves efficiency, and offers consistent results for the user. Macros are easy to create using built-in tools.
